INTRODUCTION TO FOR LOOPS

A for loop repeats a block of code for each value in a sequence.

RUNNING SUM
A running sum stores the total as values are processed. To find the sum from 1 through n, start total at zero, then for each number from 1 to n add that number to total.

PSEUDOCODE

```
read n
total = 0
for number from 1 through n:
    total = total + number
print total
```

EXAMPLE
Input: 4
Output: 10
The loop adds 1, then 2, then 3, then 4.

BOUNDARY CASE
Input: 1
Output: 1

The loop should include both endpoints and print one integer followed by a newline.
